TITLE: "BOXES AND LINES"

by Tim Bryce Managing Director M. Bryce & Associates (MBA) P.O. Box 1637 Palm Harbor, FL 34682-1637 United States Tel: 727/786-4567 E-Mail: timb001@phmainstreet.com Yahoo! IM: littleleaguerng WWW: http://www.phmainstreet.com/mba/ Since 1971: "Software for the finest computer - the Mind"

"Documentation is an inherent part of the design process." - Bryce's Law

INTRODUCTION

I recently overheard a Business Analyst say there was more to systems architecture than drawing boxes and arrows on a piece of paper. This may be true to a degree, but the ultimate deliverable of any engineering/architectural practice is a set of drawings from which to build a product. Architects and engineers do not spend all of their time drawing diagrams; for example, they have to specify requirements and analyze such things as the stress of components to determine the suitability of materials for use in design. But aside from this, the end result of engineering or architecture, their deliverable, is a set of drawings, be it a blueprint, a floor plan, wiring diagram, plumbing, or a set of flowcharts.

Such drawings basically consist of boxes and arrows. Boxes (be it squares, rectangles, polygons, circles, etc.) represent tangible objects and lines represent relationships between such objects. Flowcharts are similar; here, boxes represent specific types of processes or decisions or objects such as inputs/outputs/files, and lines represent dependencies between them (comes from/goes to).

Although drawings typically consist of geometric shapes, it is not uncommon to include tables or indices to represent decisions or to provide a cross-reference. Nonetheless, boxes and lines represent the principal means to visualize and communicate a design regardless of the structure to be built, and have been used since time immemorial.

In addition to diagramming techniques, engineers and architects have found it useful to develop models and prototypes to evaluate the overall physical aspects of their design. These are useful but let us not forget they are all ultimately based on a design of some kind (boxes and lines). From the models and prototypes, designs can be adjusted as required.

I guess what I'm driving at is that despite all of this peripheral activity, and to refute my Business Analyst friend, the principal thrust of the engineer or architect is to produce and maintain a reliable set of drawings. It all comes down to boxes and lines. Interestingly, today's analysts and programmers think drawings are "old-hat" or passé. I don't care whether you draw it with pencil and paper or by computer, documentation is an inherent part of the design process. Failure to recognize this is to deny reality.

In terms of the Information Systems industry, flowcharts have been used for years, well before the introduction of the commercial computer in business. Originally they included process diagrams; later they were used by programmers as a convenient means to document program logic. Such flowcharts typically made use of ANSI standard flowcharting symbols. But as the Structured Programming movement flourished in the late 1970's, ANSI symbols were considered archaic, and many new types of diagramming techniques emerged, including Bubble Diagrams, Data Structure Diagrams, E/R Diagrams, HIPO, VTOC, etc. (anybody remember Nassi-Schneiderman Charts?). I could argue the pros and cons of the various techniques but that is not the point. What is important is that all of these diagramming techniques acknowledged documentation as an inherent part of the design process.

Today, documentation of any kind is considered a taboo (particularly among the Agile Methodology people). Small wonder the IT Industry is experiencing the same type of problems today that we experienced 35 years ago in terms of managing design complexity.

BLUEPRINTING

It is a myth that one type of diagramming technique can be used for all development work. This would be like suggesting to use a wiring diagram to represent a floor plan. Different needs, different graphics, different purposes. There are actually four types of graphics to be used to the different levels of system design. This implies a blueprinting approach with various levels of abstraction, from general to specific. As we have discussed in the past, the "PRIDE"-Information Systems Engineering Methodology (ISEM) looks at a system as a product that can be engineered and manufactured like any other product and, as such, defines four levels of detail in a system's hierarchy:

(continued from page 1)	thereby becoming a burdensome task. Instead, docu- mentation should be a natural byproduct of the design
LEVEL 1 SYSTEM	process. Just as blueprinting is an inherent part of the design process to architects and engineers, so should flue be the state of the
LEVEL 2 SUB-SYSTEMS (Business Processes) LEVEL 3	flowcharting be to system developers. And you shouldn't have to be a rocket scientist to draw a flowchart, keep it simple and try to use standard techniques for consistency instead of reinventing graphics every five minutes. As for me, I have no problem with ANSI standards; it works.
